

ARDB Information:

List of Holstein & Brown Swiss content of Red Genetics Sires

To assist with your breeding plans, particularly for those building bull dam lines or wishing to submit young bulls for PT selection, the ARDB has compiled the following list of sires with greater than 12.5% genetics from another breed. Only 2 bulls per year will be approved for progeny testing with greater than 25% Holstein Genetics to ensure the ARDB progeny test program remains committed to providing an alternate, high genetic, third breed to the crossbreeding industry.

We have also noted the Brown Swiss content were applicable. Given the heavy use of Orraryd in Australia, with 18.75% Brown Swiss content, this list will help those not wanting to double up with Brown Swiss genetics when mating over either Orraryd or Orraryd son's daughters.
